BENCH VALIDATED

Temporary Internal Stabilisation (TIS) for Critical Long-Bone Defects

A modular intramedullary system designed for staged reconstruction with PMMA spacer compatibility

A new category between external fixation and definitive reconstruction

- PMMA COMPATIBLE
- MODULAR DESIGN
- HA-AG COATING
- MECHANICAL AXIS

MEET US AT

EFORT Congress 2026

Poster — Temporary Stabilisation of Critical Bone Defects

5 MAY

13:00 - 14:30

Current limitations

- No dedicated internal solution for defect management
- External fixation increases complications and patient burden
- Lack of systems compatible with PMMA spacers

CITadel system

- Modular intramedullary design
- Mechanical-axis internal stabilisation
- Full PMMA spacer compatibility
- Selective HA–Ag antibacterial interface

Use cases

- Infected critical bone defects
- Blast and high-energy trauma
- Oncologic segmental resection

Why CITadel

- Internal stabilisation where external fixation is often the only option
- Designed specifically for staged reconstruction
- Defect-focused construct logic

Internal stability where external fixation used to be the only option
