

Temporary Internal Stabilisation (TIS) for Critical Long-Bone Defects

A modular intramedullary system designed for staged reconstruction with PMMA spacer compatibility

- ✓ **PMMA spacer compatible**
Full compatibility with cement spacers
- ✓ **Modular design**
Adaptable to various defect lengths
- ✓ **HA-Ag antibacterial coating**
Selective interface for infection control
- ✓ **Mechanical-axis alignment**
Internal stabilisation on anatomical axis

● TRL 4-5

● BENCH VALIDATED

Poster — Temporary Stabilisation of Critical Bone Defects

5

MAY

13:00 - 14:30

Current limitations

- No dedicated internal solution for defect management
- External fixation increases complications and patient burden
- Lack of systems compatible with PMMA spacers

Use cases

- Infected critical bone defects
- Blast and high-energy trauma
- Oncologic segmental resection

CITadel system

- Modular intramedullary design
- Mechanical-axis internal stabilisation
- Full PMMA spacer compatibility
- Selective HA-Ag antibacterial interface

Why CITadel

- Internal stabilisation where external fixation is often the only option
- Designed specifically for staged reconstruction
- Defect-focused construct logic

Internal stability where external fixation used to be the only option
